# Constructors

## What is a constructor?

- initializes an object when it is created
- has the same name as its class
- syntactically is like a method
- have no explicit return type

Java automatically provides a **default constructor** that initializes all member variables to zero. If you define your **own constructor**, the default constructor is no longer used.

Java allows two types of constructors

- No argument Constructors
- Parameterized Constructors

# Let's play with constructors

```
1 package lab6;
2
3 public class NoArgument {
4     int num;
5     NoArgument(){
6         num = 100;
7     }
8
9 }
```

```
1 package lab6;
2
3 public class Parametrized {
4     int num;
5     Parametrized (int i){
6         num=i;
7     }
8
9 }
10
```

```
1 package lab6;
2
3 public class Exercise1 {
4
5     public static void main(String[] args) {
6         // TODO Auto-generated method stub
7         NoArgument o1 = new NoArgument();
8         Parametrized o2 = new Parametrized (10);
9         System.out.println(o1.num + " " + o2.num);
10    }
11
12 }
```

# Packages

**Package** is a grouping of related types (classes, interfaces, enumerations and annotations ) providing access protection and namespace management.

Packages are divided into two categories:

- Built-in Packages (packages from the Java API)
- User-defined Packages (create your own packages)

Some of the built-in packages in Java are –

- **java.lang** – bundles the fundamental classes (This package is automatically imported)
- **java.io** – classes for input , output functions are bundled in this package
- **java.awt** - Contain classes for implementing the components for graphical user interfaces (like button , ;menus etc)

# Why Packages

Packages are used in Java in order

- to prevent naming conflicts
- to control access: protected and default have package level access control. A protected member is accessible by classes in the same package and its subclasses. A default member (without any access specifier) is accessible by classes in the same package only.
- to make searching/locating and usage of classes, interfaces, enumerations and annotations easier, etc.
- To write easier maintainable code

# *How to create user-defined Packages*

Use of the Key word **package**

Package statement is the first line of the source file

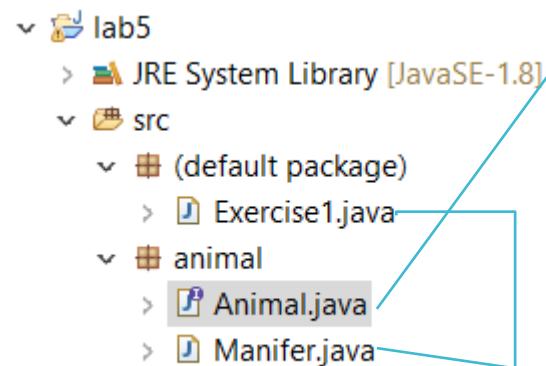

It can be only one package statement in each source file

If **package** statement is not used then the class, interface, enumerations and annotation type will be placed in the current default package

# How to use Packages

- If a class wants to use another class in the same package, the package name need not be used. Classes in the same package find each other without any special syntax
- What happens if we want to use a class that is not in the same package? Then use one of the following techniques for referring to a class in a different package.
  - The fully qualified name of the class can be used. For example – payroll.Employee
  - The package can be imported using the **import** keyword and the wild card (\*). For example – import payroll.\*;
  - The class itself can be imported using the import keyword. For example – import payroll.Employee;
  - Note – A class file can contain any number of import statements. The import statements must appear after the package statement and before the class declaration.

# Package

```
Animal.java  Manifer.java  Exercise1.java ✕
1  import animal.*;
2
3  public class Exercise1 {
4      public static void main(String[] args) {
5          Manifer o = new Manifer ();
6          o.travel();
7      }
8
9  }
10
```

```
Animal.java ✕  Manifer.java  Exercise1.java
1  package animal;
2
3  public interface Animal {
4      public void eat();
5      public void travel();
6  }
7
```

```
Animal.java  Manifer.java ✕  Exercise1.java
1  package animal;
2
3  public class Manifer implements Animal {
4      public void eat() {
5          System.out.println("Manifer eats");
6      }
7
8      public void travel() {
9          System.out.println("Manifer travels");
10     }
11
12     public int noOfLegs() {
13         return 0;
14     }
15
16     public static void main(String[] args) {
17         Manifer m = new Manifer();
18         m.eat();
19         m.travel();
20     }
21 }
22
```

int animal.Manifer.noOfLegs()

Press 'F2' for focus

# Package Directory Structure

> AnritsuLeaderProgramm > Master TCSI Teoria Codarii si Stocarii informatie > java > lab > lab5 > src >			
Name	Date modified	Type	Size
animal	5/10/2020 12:27 AM	File folder	
Exercise1	5/10/2020 12:28 AM	JAVA File	1 KB

rogramm > Master TCSI Teoria Codarii si Stocarii informatie > java > lab > lab5 > src > animal			
Name	Date modified	Type	Size
Animal	5/9/2020 11:39 PM	JAVA File	1 KB
Mamifer	5/10/2020 12:28 AM	JAVA File	1 KB

A package/folder with the name **animals** will be created in the current directory and these class files will be placed in it as shown below.

# Packages Prevent Name Conflict

19        m.eat();
20        m.travel();
21    }
22 }
```

Mamifer.java

```
1 package test;
2
3 public class Mamifer {
4     public void eat() {
5         System.out.println("Manifer eats a lot");
6     }
7
8     public void travel() {
9         System.out.println("Manifer travels a lot");
10    }
11
12    public int noOfLegs() {
13        return 2;
14    }
15 }
```

# Java I/O Standard Streams

The java.io package contains nearly every class you might ever need to perform input and output (I/O) in Java

All the programming languages provide support for standard I/O where the user's program can take input from a keyboard and then produce an output on the computer screen. Java provides the following three standard streams –

- **Standard Input** – This is used to feed the data to user's program and usually a keyboard is used as standard input stream and represented as **System.in**.
- **Standard Output** – This is used to output the data produced by the user's program and usually a computer screen is used for standard output stream and represented as **System.out**.
- **Standard Error** – This is used to output the error data produced by the user's program and usually a computer screen is used for standard error stream and represented as **System.err**.

**System.out** is not new for us  
Let's play a bit with **System.in**

# Standard Stream System.in

```
1 package lab6;
2
3 import java.io.*;
4
5 public class ReadConsole {
6
7     public static void main(String[] args) throws IOException {
8         // Citesc de la tastatura caractere si le afisez pana cand se tasteaza caracterul q
9         InputStreamReader cin = null;
10        try {
11            cin = new InputStreamReader (System.in);
12            System.out.println("Enter characters, 'q' to quit.");
13            char c;
14            do {
15                c = (char) cin.read();
16                System.out.print(c);
17            } while(c != 'q');
18        } finally {
19            if (cin != null) {
20                cin.close();
21            }
22        }
23    }
24 }
25
26 }
```

Enter characters, 'q' to quit.  
aaaaaas  
aaaaaas

# Homework

Please write a new app in Java that fills an array of chars from the keyboard. The size of the array must be read also from the keyboard.
